

Progress Report Of Course Project

1) Name of the Team Members:

- Jaeha Huh (jh6035), CJ Nnorom (cjn310)

2) What technology are you are using?

- Python, Java script, html

3) If you are working with a partner/two partners, how did you divide work load. Who will do which part?

- Jaeha Huh: View public info, Register, Customer use cases, ER diagram, SQL files

- CJ Nnorom: Login, Airline Staff use cases, Relational schema

4) What's your plan to finish the project in time?

- We will correct the error about the Data Definition Language (DDL) file, complete the database part first, and then complete the web part.

5) Are you currently facing any problems?

- There was a problem changing from relational schema to DDL file, so, we need to solve the problem first. Also, we are not used to using python flask yet, so if there is a problem about that, we will ask questions to the professor or TA.

6) How many use cases have you completed so far?

- Register, View my flight (Customer)

7) Did you create the tables in the databases? Do you plan to have any additional features?

- Yes, we finished creating a DDL file to create a table for the data, but when we changed the relational schema, we re-created the DDL file. However, there is a syntax problem in the DDL file, so the tables are not all created in the database. And so, we are going to solve this problem first.

8) Did you inserted data in those tables?

- Yes, we completed the insert file to put in the table, but we had to change the DDL file because there was an error while changing the DDL file by changing the relationship schema. So, we need to change the contents of insert file according to the table that will be created by changing DDL file.
